Date:

Examination: Histopathological examination

Patient:

PESEL:

Age:

Gender: F

Examination No.:

Material: Multiple organ resection – left breast

Unit in charge:

Physician in charge:

Material collected on

Material received on

Expected time of examination: up to 8 working days

Clinical diagnosis: Cancer of the left breast (inner lower quadrant).

Examination performed on:

Macroscopic description:

Left breast, sized 21.8 x 21.2 x 6.5 cm, removed along with axillary tissues sized 11 x 7 x 3 cm and a skin flap of 21.2 x 11.1 cm. Weight 1,360 g. Tumour sized 2.8 x 2.1 x 1.5 cm found on the boundary of inner quadrants, placed 3.6 cm from the upper edge, 0.9 cm from the base and 2.8 cm from the skin. Status after core needle biopsy (test No

Microscopic description:

Carcinoma ductale invasivum NHG3 (3+3+3: 35 mitoses /10 HPF - visual area: 0.55mm).

Foci of carcinoma ductale in situ (DCIS) found within tumour (solid type, with high nuclear atypia and comedo necrosis, 10% of the tumour).

Reactio lymphocytaria peritumoralis.

Lesions in situ: cancerisatio lobulorum.

Mamilla sine laesionibus.

Glandular tissue showing parenchyma atrophy.

Axillary lymph nodes:

Lymphonodulitis reactiva No XI.

UUID:F8C2F3EF-FA73-4FF8-9A4E-7F557E68D560
