

1CD-0-3

Carcinoma, infiltrating duct, NOS 8500/3
Site: breast, NOS C50.9

Breast, right, lumpectomy: Infiltrating ductal carcinoma, Nottingham grade III (of III) [tubules 3/3, nuclei 3/3, mitoses 2/3; Nottingham score 8/9], forming a 2.4 x 2.1 x 1.5 cm mass [AJCC pT2]. Ductal carcinoma in situ, intermediate nuclear grade, comprising approximately 5% of tumor volume. Angiolymphatic invasion is present. The non-neoplastic breast parenchyma shows proliferative fibrocystic changes. Calcifications present in benign ducts and acini. Biopsy site changes present. All surgical resection margins, after re-excision of the lateral-deep margin, are negative for tumor (minimum tumor free margin, 0.4 cm, deep margin).

Lymph nodes, right axillary, sentinel biopsies: Two (of 3) axillary sentinel lymph nodes are positive for metastatic carcinoma [AJCC pN1]. Extranodal extension is present. Immunohistochemical cytokeratin stain was performed on the paraffin embedded sentinel lymph node tissue (sentinel node #3) and confirms the H&E impression.

Lymph nodes, right axillary, dissection: Multiple (13) axillary lymph nodes are negative for tumor.
